

Alexa integration manual

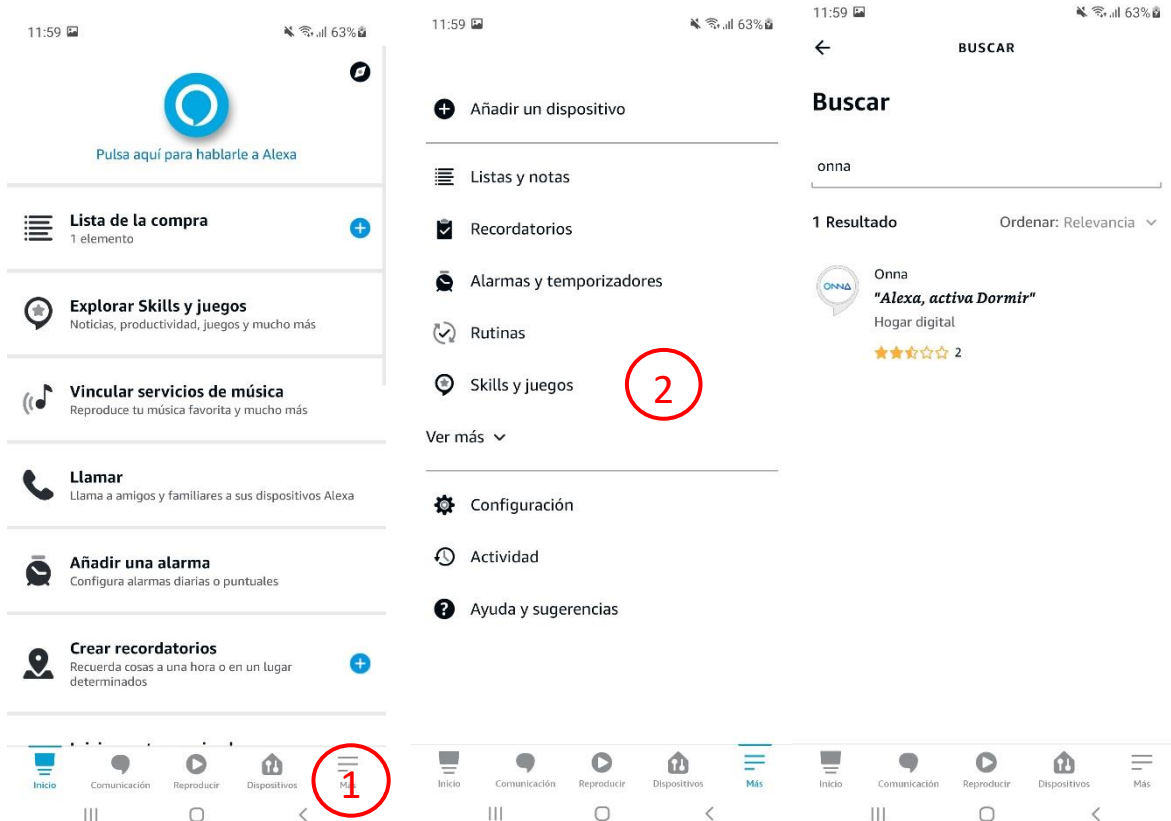

Note 1: In order to connect Onna to Alexa, it is essential that the installation has Internet access and that the mobile device has the Onna app fully operational and linked to the Onna server.

Note 2: The customer must have an Amazon account with their username and password and install the Amazon app on the same mobile device where the Onna app is located.

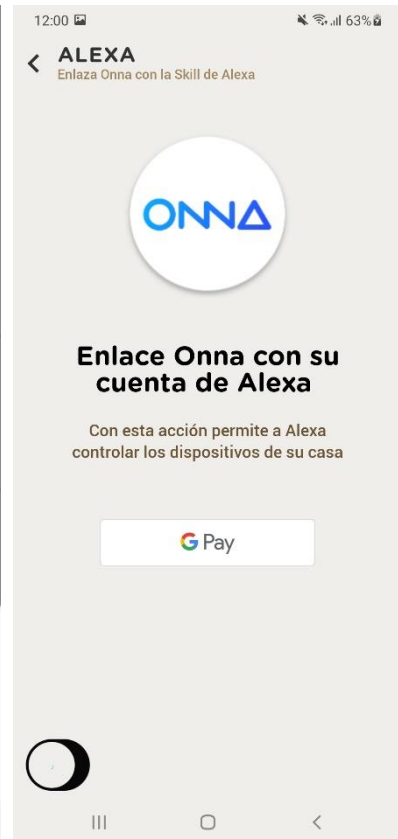

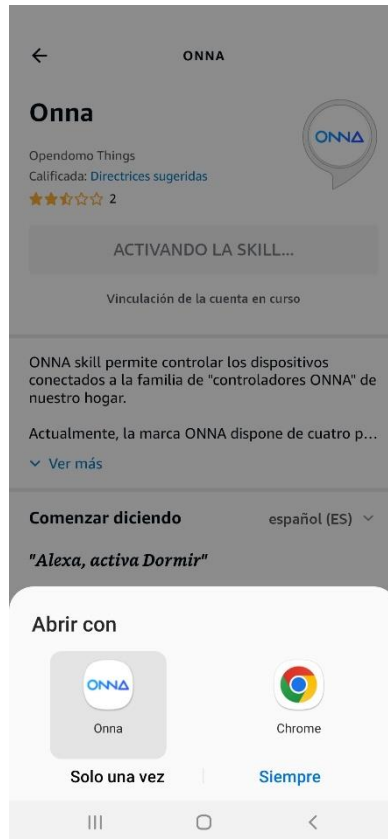

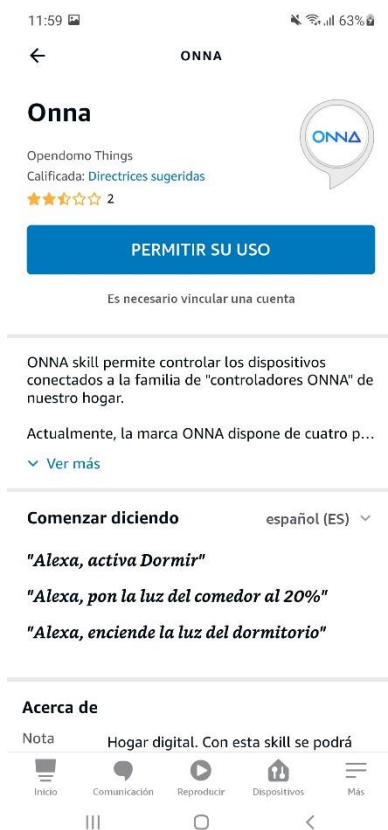

When you open the Onna app on your mobile device, a start screen like the one below will appear, showing that the Onna system is operational and the connection is correct:

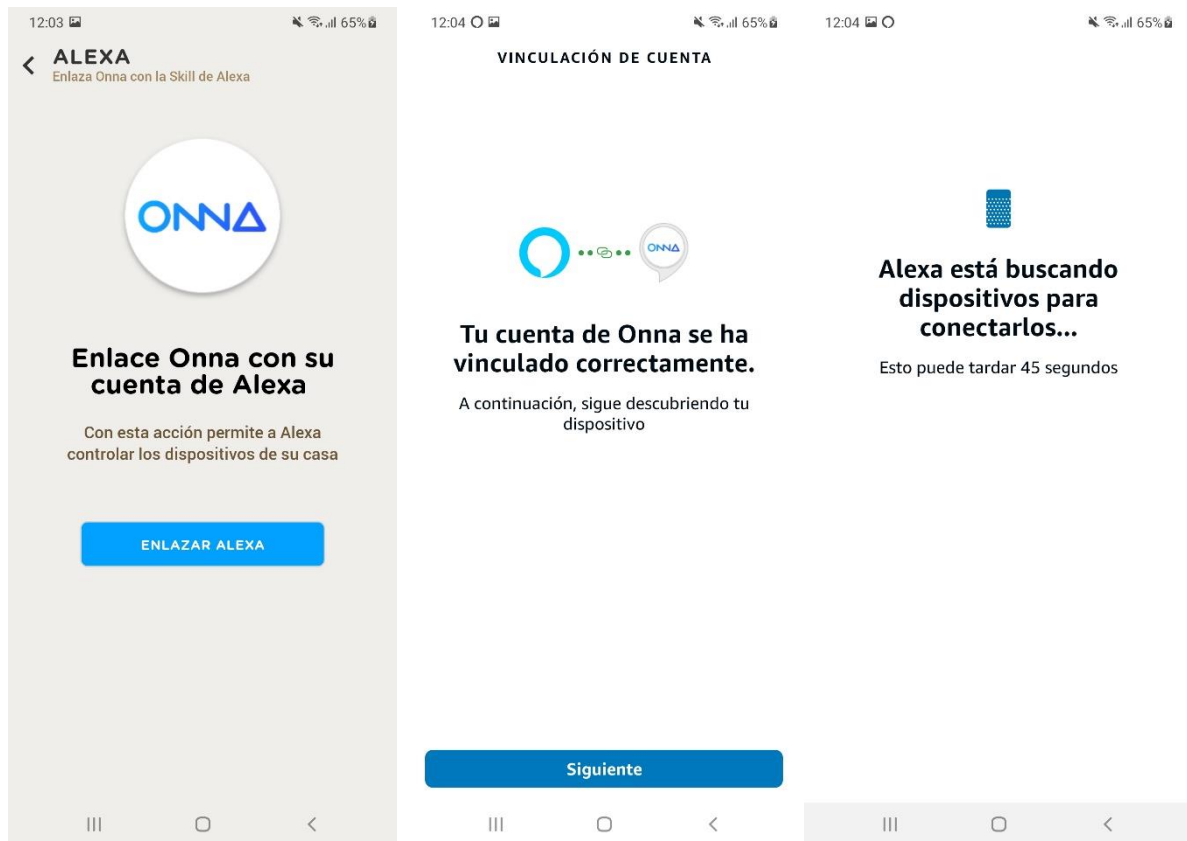

Once you have verified that the Onna app is operational, open the Amazon Alexa app and enter your user credentials. The following home screen will appear. Navigate to the 'More' menu. From there, select 'Skills and Games' and search for 'Onna':

You must select to allow its use, and this action will redirect you to the Onna app. If the system does not have voice control enabled, it will request the corresponding payment for its activation.

Once payment has been made or if the system already has the premium service, you can click on 'Link Alexa' and Alexa will automatically search for devices.

If the process is completed successfully, Alexa will report the detected devices and it will be possible to control them by voice.
