

Alexa Integration Guide

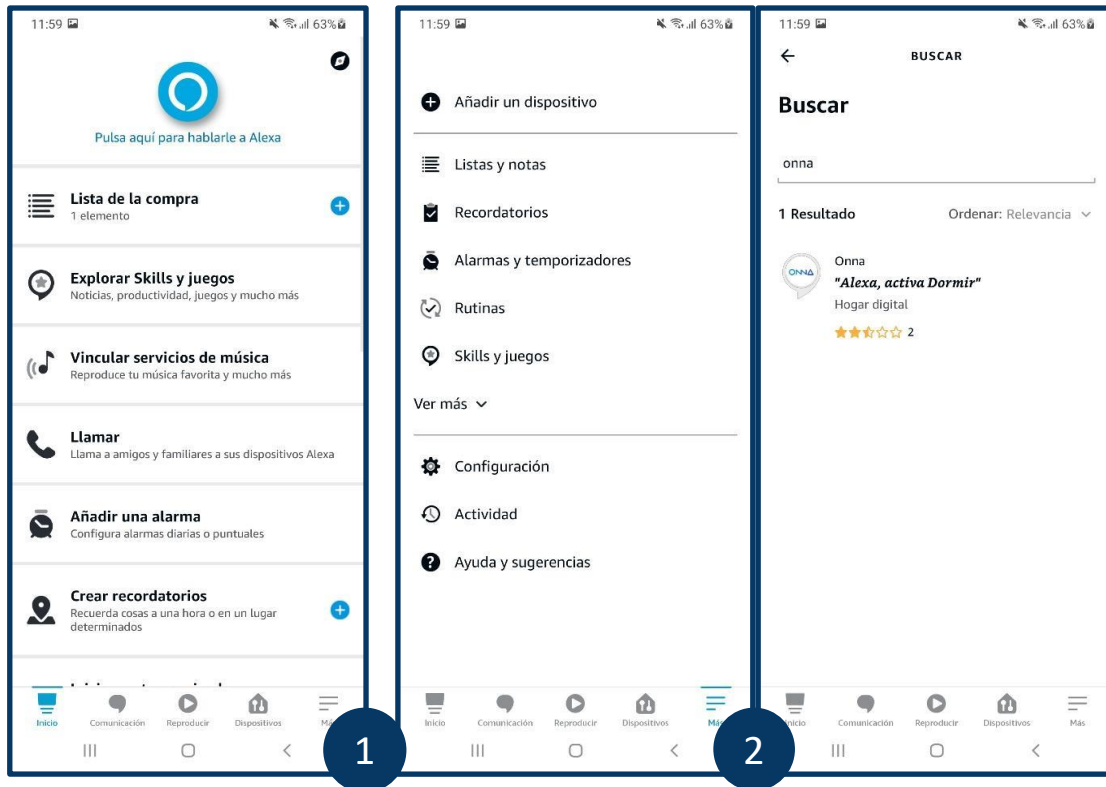

Note 1: To link **Onna** to Alexa, the installation must have internet access and the mobile device must have the Onna app fully operational and linked to the **Onna** server.

Note 2: Customers must have an Amazon account with a username and password, and must install the Amazon app on the same mobile device on which the **Onna app** is installed.

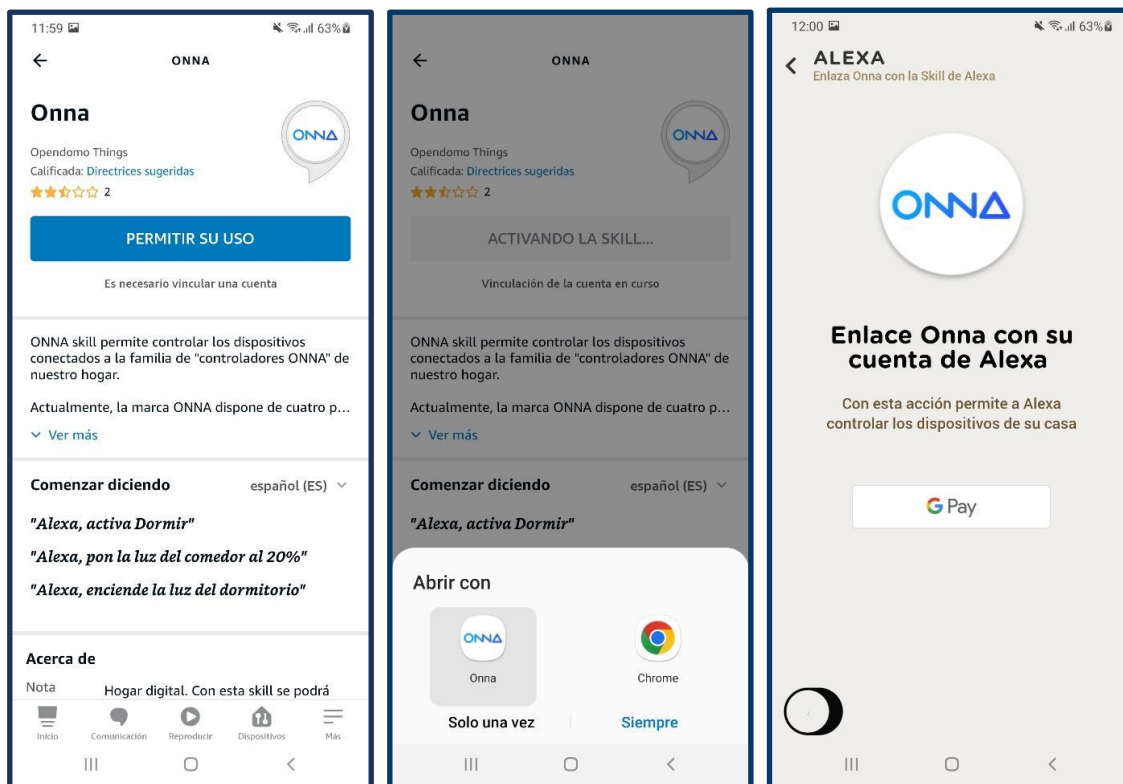

When you open the **Onna app** on your mobile device, a home screen like the one below will appear, showing that the Onna system is up and running and that the connection is working properly:

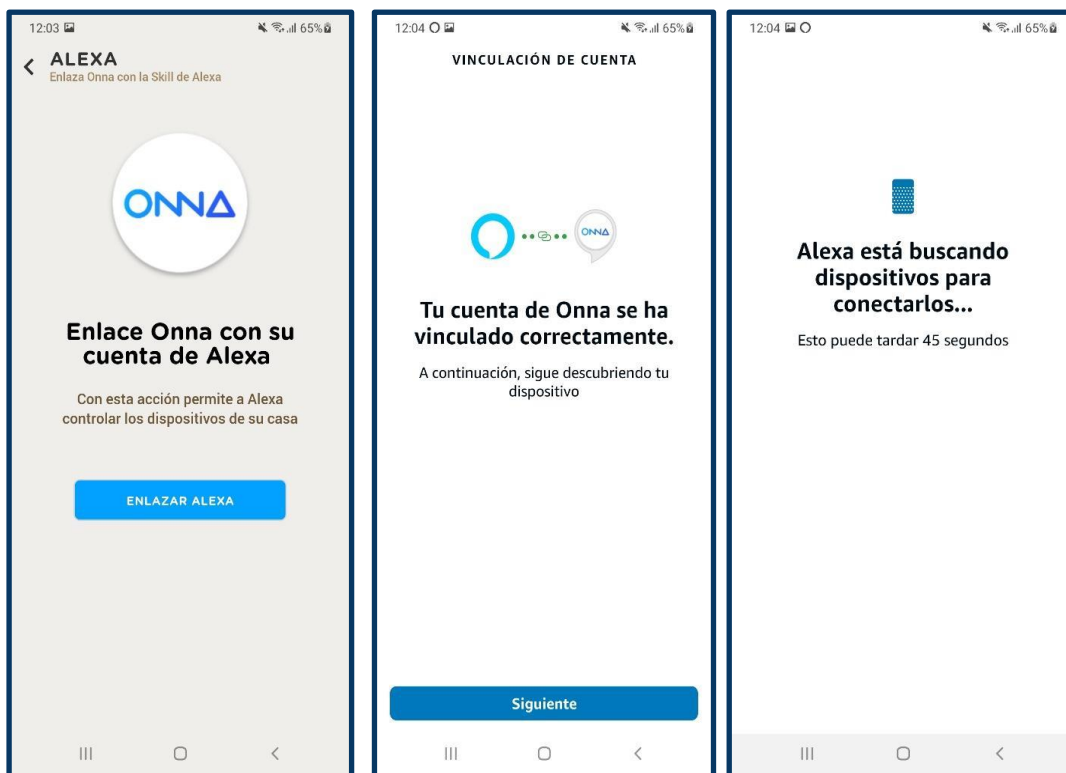

Once you have checked that the **Onna app** is up and running, open the Amazon Alexa app and enter your login details. The following home screen will appear; navigate to the “More” menu. From there, select “Skills and Games” and search for “**Onna**”:

You must select 'Allow' and this will redirect you to the **Onna app**. If voice control is not enabled on your device, you will be asked to pay the relevant fee to activate it.

Once payment has been made, or if the system already has the premium service, you can click on “Link Alexa” and Alexa will automatically search for the devices.

If the process is completed successfully, Alexa will report the devices that have been detected, and you will then be able to control them using voice commands.
